

WEEK 5 -LAB SESSION TASK

22nd of Oct and 5th of Nov

Everyone in each pair individually reads around the topic and makes decent notes outlining arguments in favour of their “assigned opinion”. Each pair has to present a balanced 5 mins presentation and a slide deck (please send slides to TAs in advance). Students will be also required to prepare questions for their course mates in other teams, so please look through the topic list and brainstorm possible follow up questions!

The presentations should contain: 1) arguments for 2) arguments against 3) how did you change your minds over the course of the exercise? 4) where do your opinions differ and why? 5) can you reach a common conclusion?

During the 22nd of Oct session, you will be assigned to a topic, a position (for/against) and a pair.

Topic list:

1. We should consider paying ransoms after cyber-attacks.
2. Users should be paid for their personal data.
3. Social media platforms should protect users’ sensitive information by default.
4. No one should be anonymous online
5. Every machine should come with a virtual private network (VPN) by default
6. Digital consent is meaningless
7. Inclusive security is too expensive for companies to implement.
8. Secure “development” or “programming” should be taught at first year.
9. Manufacturers should do more towards protecting phones from theft.
10. We need backdoors in our encryption systems.
11. “Anonymous” hacker group are heroes.
12. Open-source software is inherently more secure than proprietary software.
13. Protecting your smartphone is your personal responsibility
14. It’s a developer’s responsibility to build secure products
15. Facial recognition technology should be banned in public spaces.
16. Cybercrime victims should be compensated by the hacked organisations
17. There’s no point in keeping your social media presence private
18. Hacker representations in Hollywood did more harm than good to the security community
19. Computer security education should be made part of the basic education.
20. Platform or service owners should compensate users when there is a hack or data breach
21. Computer hackers should be paid for being able to hack systems.
22. We should let AI handle Cyber security.
23. Tech products should be designed with marginalized communities in mind.
24. Countries should be allowed to hack each other.
25. Privacy is dead.
26. Zero-trust architecture is the future of secure systems.
27. Security updates should be mandatory and not optional.
28. Security nudges are manipulative.
